### Sprint Burndown Charts

The burndown charts provided illustrate the progress of work across individual sprints and cumulatively throughout the project. Each sprint-specific chart plots the **remaining number of tasks** over a 7 or 14 day period, with an **ideal trend line** showing the expected steady pace of completion and an **actual line** reflecting real progress, which may vary due to development dynamics. These charts show a general **downward trend**, indicating that work is being completed over time, even if not always at the ideal pace.

The **combined burndown chart** aggregates all tasks across the five sprints, presenting a unified view of project progress over approximately 40 days. It includes **milestone dividers** marking the end of each sprint, helping to visualize momentum shifts between phases. While the ideal line slopes consistently toward zero, the actual line reflects natural project variability—such as slower starts or mid-sprint acceleration. Overall, these charts help teams identify pacing issues, adapt planning in retrospectives, and ensure project goals stay on track.

Below are Charts for each Sprint as well as the combined burndown chart on page 4.

Sprint 1 (Setup & Auth) Burndown Chart

Sprint 2 (Navigation & Roles) Burndown Chart

Sprint 3 (Core Booking) Burndown Chart

Sprint 4 (Maintenance, Feedback & Polish) Burndown Chart

Cumulative Burndown Chart Across All Sprints
